# Outline

## Algorithms

## Performance evaluation

## Proposal

# Algorithms

- ▶ Split the problem in two stages:
  1. Find maximal disks at each timestamp (MaximalFinder) and
  2. Join maximal disks between adjacent timestamps (FlockFinder)
- ▶ Pseudocode for both algorithms available online: [MaximalFinder](https://tinyurl.com/y74lld5k)<sup>1</sup> and [FlockFinder](https://tinyurl.com/yac26guf)<sup>2</sup>.

# Maximal finder overall steps

1. Indexing points...
2. Getting pairs...
3. Computing centers...
4. Indexing centers...
5. Getting disks...
6. Filtering disks  $< \mu$ ...
7. Prunning duplicate candidates...
8. Indexing candidates...
9. Getting expansions...
10. Finding maximal disks...

# Flock finder

1. Set of disks for  $t_i$ ... *Set of disks for  $t_i + \delta$ ...*
2. Joining timestamps
3. Checking internal timestamps

# Outline

Algorithms

Performance evaluation

Proposal

# Performance

1. Show performance analysis by steps
2. Highlight the bottlenecks
